No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This sequence represents an N-terminal transmant of hossin growth homeone (hGH) which is a component of a chineric protein (AAV42661) which also contains a kinacinostlin precursor (AAV42869). He 5GH portion of the chineric protein acts as an intramolecular chaperone (1MG) for the chineric protein acts as an intramolecular chaperone (1MG) for the financial acts and intramolecular content of protein to be removed after (50.41Mg has taken place). Production of recombinant human insulin with correctly linked cysteine bridges with fewer necessary procedural steps, and hence issulting in a higher yield of human insulin with correctly linked cysteine bridges with fewer necessary procedural steps, and hence issulting in a higher yield of human insulin The IMC sequences not only protect insulin sequences from intracellular degradation by a microorganish host, but sequence the folding of the fused insulin procursor in commercially used; in interactions among the fusion proteins, thus a leading folding of the interactions among the fusion proteins, thus a leading folding of the fusion protein states and concentrations. The procedural steps of cyanogen bromide cheaved, exidually established purification steps can this be eliminated, accentrations and related purifications of mercaptum or turn are of hydropicit;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, anti-angiogenic; prolactin; placental jactogen; LFE; angiogenics; placental defendal cell proliteration; placental ascularisation; pregnancy; treatment; andiogenic disease; tumour; inhibitor; malignant; angiofibroma; arrentovenous malformation; artificitis, atherosocierotic plaques; corneal arcait neovascularisation; artificitis, atherosocierotic plaques; corneal arcait neovascularisation; artificitis, atherosocierotic plaques; corneal arcait neovascularisation; yrandualion; quancoma; ordiar; uveitis; fracture; calerraction; trachomo; psoriasis; tibroplasia; solaroderma; kaposi's sarcoma; vascular addession; ulcor; leukacemia; reproductive disorder; contucoptive arcait; addession; yene therapy; pre-colarpsia; intrautetice growth; relardation;

peptides can be used for preventing or treating e.g. maignant tumours, anglibroma, arteriavencies malformation, arthritic such as rheumatoid artifits, atterosciencic plaques, conneal graft necesscularisation, delayed wound healing, proliferation, granulations such as those occurring in hemophilic joints, inappropriate vascularisation in wound healing such as hyperticiphic scars or keloid scars, necesscular glaucoma, ocular tumoir, uvatis, non-union fractures, Oslar-Weber syndrome, psoriasis, pyogenic glaucoma, retrolental fibroplasia, scleroderma, solid tumours, Kaposi's sarcoma, trachoma, vascular adhesions, chronic varioose ulcors, leukaemia, and reproductive disorders such as follicular and luteal cysts and choriocarcinoma. They can also be used as contraceptive agents. DNA encoding the peptides can be used in gene therapy. The measurement of abnormal levels of N-terminal fragments of health, hGH-V, prolactin or hPL can be used in assays for impairment of vascular development associated with pre-eclampsia, intrauterine growth retardation, and placental
                                                                                                                                                                                                                                        this invention describes novel human anti-anglogenic peptides derived from 10 to 150 consecutive amino acids selected from the N-terminal end of the hard placental lactogen (hPL), human growth hormone (hGH), growth hormone variant (hGH-V), or human prolactin. Such peptides (i) inhibit capillary endothellal cell proliferation and organisation (ii) inhibit capillary endothellal cell proliferation and organisation (ii) inhibit capillary endothellal cell proliferation and organisation (ii) inhibit less, hor specific receptor which does not bind an intact full length hGH, hPL, prolactim or hGH-V. The invention also describes a method for diagnosing a probable abnormality of placental vascularisation during prequency. The peptides can be used for treating an angiogenic disease in modulating vascularisation of a patient's placenta. In particular, the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 MFPT1PLSRLFDNAMLRAHRLHQLAFDTYQEFEEAYIPKEQKYSFLQNPQTSLSFSESIP

Human growth cormone segment, used at the N-terminal of a fusion protein, which contains a thrombin recognition site, and human beta nerve growth factor (beta-NGF) at the C-terminal. Beta-NGF can be used to control geriatric dementia and other nervous disorders, and can be released from the fusion protein by incubation with thrombin (see AAN90577-8, AAP91034, AAF91299).
                                                                                                                                                                                                                                                                                                     w human nerve growth factor gene encoding fusion protein having cleavage site for thrombin, useful for treating gerlatric

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence represents a chameric protein, which contains an N-terminal fragment of human growth hormone (h6H) of the sequence given in AAV42855, a cleavable peptide linker (AAV42857), and a human insulin precursor comprising insulin A and B chains (AAV42859). The h6H portion of the chimeric protein acts as an intrancledular chaperone (lNC) for the insulin precursor, enabling it to find correctly. The cleavable peptide linker has a C-terminal Arg residue which enables the r6H portion of the chimeric protein to be removed after (olding has taken protein an provide himan insulin with correctly inhed cysteine bridges with fewer necessary procedural steps, and nemer resulting climeric protein can provide himan insulin with correctly inhed cysteine bridges with fewer necessary procedural steps, and nemer resulting the higher protein can invariant degradation by a microorganism issulin to sequences from intracellular degradation by a microorganism issul, but allocated for the fusion proteins and decrease the intermolecular interactions among the fusion proteins and decrease the intermolecular interactions among the fusion proteins and decrease the intermolecular procedural steps of cyanogen mosable cleavage, widative supplicitives and related purification siegs con this allocated, along with the corrections and related purification siegs can this be editinated, along with the record of high concentrations of mercapten or the use of hydrophobic absorbent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 MEPTIPOSRIJEONAMIRAHRIJHGLAPDIYQHERBAYIPKEGKYSELQNPQISISPSESIP +0

                                 The invention consists of a vector contq. a fusion protein which is formed by ligating, downstream of a promotor, nGH or a deriv. (prot. formed by subtstn. of Net-14 With Lou) and a foreign protein. Stability of the vector in the host is greatly increased so the protein yield is higher. (Gpdated on 25-MAR-2003 to correct PA field.)

requilary endothelial cell proliferation and organisation (ii) inhibit andiogenesis in chick chorioallantoic membrane and (iii) binds to angiogenesis in chick chorioallantoic membrane and (iii) binds to angiogenesis in chick chorioallantoic membrane and (iii) binds to angiogenesis in chick chorioallantoic membrane and (iii) binds to angiogenesis in chick chorioallantoic membrane and (iii) binds to a diagnosing a probable abnormality of placental vascularisation during pregiancy. The peptides can be used for treating an angiogenic disease in calabett, for inhibiting tumour formation or growth in a patient or for medulating vascularisation of a patient's placenta. In particular, the peptides can be used for treating e.g. malignal tumours, arithmics an arthritic such as rheumatoid arthritis, atheroselerotic plaques, corneal graft neovascularisation, arthritis, atheroselerotic plaques, corneal graft neovascularisation, cellayed wound bealthy, proliferative retinopathy such as those occurring to retinopathy, macuiar degeneration, granulations such as those occurring such as hyportrophic scars or keloid scars, neovascular glaucoma, ocular function underline, moritar of fractures, osler-wheor systorome, psorfassis, progetic qlaucoma. Theromal transmissions, chronic varicose ulcers, sand cherocoma. They can also be used as contrareptive agents on the used in quel provels of Niterminal fragments of hdir hdrive and underlined associated with pro-equancial levels of Niterminal fragments of hdir hdrive and placental cannel growth retardation, and placental dysinant of vascular development associated with pro-equancient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 MFPTIPLSRIFONAMLRAHRLHQLAFDTYQEFEEAYIPKEQKYSFLQNPQTSLSFSESIP 60

                                                                                                                                                         N-terminal end (1st region), a 3 amino acid sequence representing thrombin recognition site, and binner beta nerve growth factor (beta-N3F) at the C-terminal. Beta-N3F can be used to control geriatric describe and other nervous disorders, and can be released from the fusion protein by incubation with thrombin (see AAN90577-8, AAP91034).
                                                                                                                                                                                                                                                                                                                                                                                              1 MPPTIPLSRLFONAMLRAHRIHQLAPDIYQEFEEAYIPKEQKYSFUQNPQTSLSFSESIP 60

It is purified by contacting a gel having a cation exchange gp. with the fusion protein, in the presence of urea. The purified protein is useful in a medicament for treating disorders of the nervous system, cg dementia.

```

```
The polypeptide (AAPB1226) with somatomedin-like activity and the DNA (AANB1605) encoding it are claimed. A Met resicual qp. may be added to the N-terminal. The polypeptide acts on the hone structure of mammals, including humans, to promote bone growth. The polypeptide has high production rate and is casily extracted from botterial culture medium and refined for use as a bone growth accelerator. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                            The protein is a direct translation of the upstream tryptophan promoter-operator lacking its attenuation sequence and human abderance squence. The product may be efficiently expressed from a transformed E.coli expression system.

administered substance from a naturally-occurring endogenous substance from a naturally-occurring endogenous substance the exogenous substance being tagged so that it fluoresces differently from the endogenous one at a suitable wavelength. The tagging may consist of one or more substitutions in tagged growth hormone selected from 340V, 52V, w86F, Y, L, I or V FIGTY or 113TY. The method is used to distinguish between exogenously administered substances as compared to naturally-occurring endogenous substances. Especially mentoned is the integral manuals e.g. cattle. The present sequence represents mainly be used to the contract of the present of the contract of th

The present invention describes a human arowth housone mitten, is which the 134th Arg and the 135th Thr are replaced respectively by Asp and Brothn the 181s to the 191st amino acid sequence in faural type human 22 king growth hormone (fidi) and which has a resistance dealist decomposition by thrombin. The present sequence represents the vatural EGH. Also and the 140th Lys are replaced respectively by Asp. Pro and A.a in the amino acid sequence of matural type NGH and which has a resistance against decomposition by thrombin and plasmin and (2) a drap preparation containing the above HGM mutant as the active composition the motivation defined and shows a high stability in blood and tools finid. A human growth hormone mutant - with equivalent activity to natital human growth hormone Example 1: Page 5:6: 10pp: Japanese

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
